Orad presents high-definition CyberSet

Orad Hi-Tec Systems, a leader in virtual studio technologies, presents a series of new products including CyberSet HD, the first high-definition virtual studio that supports both 1080I and 720 HD formats.

The company is also releasing CyberSports, a line of new-generation sports production devices represented by its new live/instant-replay CyberSport system, which enables real-time drawing of tied-to-playing field graphics. CyberFootball draws the 10-yard line in American football, while CyberSoccer draws the 10- yard penalty circle and analyses offsides in soccer events. Other versions for basketball, track and field, and tennis are currently being developed.

Another new product called the MobileSet and Micro Panel allows the insertion of animated 3D graphics and video sequences onto a small two-toned mobile panel. Deployable in minutes, it is particularly suited for outside broadcasts of weather forecasts, sport events, as well as on-the-spot news reports.

Cameramen find increased support in Miller

Miller Digital Support offers two 100mm ball-levelling fluid heads and the enhanced DS 10 75mm MiniDV/DVCAM support system.

The DS 25 fluid head is the latest in the company's range of broadcast products. Designed for field production camcorders, it features four position-pan and tilt-drag selection, plus selectable counterbalance to help tune the head's balance into the camera/lens payload. The product is available in eight system configurations.

The DS 30 fluid head is built to handle both ENG/EFP camcorders and dockable cameras. Its counterbalance supports heavier lens/battery/adaptor payloads, as used for EFP or documentary productions. It is available in six system configurations.

The DS 10 75mm MiniDV/DVCAM support system is now available with a two-stage tripod to ensure a greater height range and more compact transport for DV users. The system is designed for Sony's DSR-200 and the Canon XL-1 mini camcorder.
